MediMind AI - Clinical Imaging & Diagnostic Scan Report

Scan Category: Chest X-Ray
Model Classifier Confidence: 85.3%
Analysis Date: 2026-06-14 12:42:12

Diagnostic Report

=====================

Patient Information

• Not provided (Please provide patient information for accurate diagnosis)

Scan Information

• Modality: Chest X-Ray

• Organ: Chest

• Position: Posteroanterior (PA) view

Primary Scan Findings

• Bilateral lung fields are clear with no evidence of consolidation or effusion.

• Cardiac silhouette is normal.

• Diaphragms are flat and even.

• No obvious signs of pneumothorax or pleural disease.

Specific Observations & Lesion/Anomaly Details

• A 2.5 cm nodule is observed in the right upper lobe (RUL) of the lung, located 2 cm from the hilum. The nodule is well-defined, round, and has a smooth margin. It is not calcified.

• A 1.2 cm nodule is observed in the left lower lobe (LLL) of the lung, located 3 cm from the hilum. The nodule is well-defined, round, and has a smooth margin. It is not calcified.

• The nodule in the RUL is slightly larger and more prominent than the nodule in the LLL.

Confidence Score Details

• The AI feature classification model reports a clinical confidence of 85.3% for the presence of lung nodules.

• The confidence score is based on the model's ability to detect and classify lung nodules in chest X-ray images.

Severity Level

• **Moderate**: The presence of two lung nodules, one in the RUL and one in the LLL, suggests a moderate level of severity. However, further evaluation is needed to determine the nature and significance of these nodules.

Clinical Recommendations

• Order a follow-up chest X-ray in 6-12 months to monitor the size and characteristics of the lung nodules.

• Consider a computed tomography (CT) scan of the chest to further evaluate the lung nodules and rule out other potential causes of the nodules.

• Refer the patient to a pulmonologist or thoracic surgeon for further evaluation and management.

Suggested Next Steps / Referrals

• Order a CT scan of the chest to further evaluate the lung nodules.

• Refer the patient to a pulmonologist or thoracic surgeon for further evaluation and management.

• Consider ordering a positron emission tomography (PET) scan to assess the metabolic activity of the lung nodules.
