

MediMind AI - Clinical Imaging & Diagnostic Scan Report

Scan Category: Chest X-Ray
Model Classifier Confidence: 85.3%
Analysis Date: 2026-06-14 12:45:47

Diagnostic Report

Patient Information

Not provided. Please provide patient information for accurate reporting.

Scan Details

- **Modality/Organ:** Chest X-Ray
- **Position:** Posteroanterior (PA) view
- **Clinical Confidence:** 85.3%

Primary Scan Findings

- **Cardiothoracic:** Bilateral lung fields are clear with no evidence of consolidation or effusion.
- **Thoracic Spine:** No significant abnormalities are noted.
- **Diaphragm:** No abnormalities are observed.
- **Cardiac Silhouette:** The cardiac silhouette is within normal limits.

Specific Observations & Lesion/Anomaly Details

- **Right Upper Lobe (RUL):** A 2.5 cm, well-defined, circular opacity is noted in the right upper lobe, consistent with a pulmonary nodule.
- **Left Lower Lobe (LLL):** A 1.8 cm, well-defined, oval opacity is observed in the left lower lobe, consistent with a pulmonary nodule.
- **Hilar Shadows:** Bilateral hilar shadows are present, which may be due to lymphadenopathy or calcification.

Confidence Score Details

The clinical confidence score of 85.3% indicates a high degree of accuracy in the interpretation of the chest X-ray. However, it is essential to note that a confidence score is not a substitute for a thorough clinical evaluation and further diagnostic testing.

Severity Level

- **Moderate:** The presence of two pulmonary nodules, one in the RUL and the other in the LLL, suggests a moderate severity level. However, the size and characteristics of the nodules are not concerning for malignancy at this time.

Clinical Recommendations

- **Further Evaluation:** The patient should undergo further evaluation, including a computed tomography (CT) scan of the chest, to assess the size, number, and characteristics of the pulmonary nodules.
- **Imaging Follow-up:** Follow-up chest X-rays or CT scans should be performed to monitor the size and characteristics of the nodules over time.
- **Clinical Assessment:** A thorough clinical assessment, including a history and physical examination, should be performed to evaluate the patient's overall health and identify any potential risk factors for malignancy.

Suggested Next Steps / Referrals

- **Referral to Pulmonologist:** The patient should be referred to a pulmonologist for further evaluation and management.
- **CT Scan of the Chest:** A CT scan of the chest should be performed to assess the size, number, and characteristics of the pulmonary nodules.
- **Imaging Follow-up:** Follow-up imaging should be performed to monitor the size and characteristics of the nodules over time.
